1. What does a neuron compute?

1 / 1 point

- A neuron computes a function g that scales the input x linearly (Wx + b)
- A neuron computes a linear function (z = Wx + b) followed by an activation function
- $\bigcirc$  A neuron computes an activation function followed by a linear function (z = Wx + b)
- A neuron computes the mean of all features before applying the output to an activation function
  - ✓ Correct

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

2. Which of these is the "Logistic Loss"?

1 / 1 point

- $L^{(i)}(\hat{v}^{(i)}, v^{(i)}) = |v^{(i)} \hat{v}^{(i)}|^2$
- $L^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1 y^{(i)})\log(1 \hat{y}^{(i)}))$ 
  - ✓ Correct

Correct, this is the logistic loss you've seen in lecture!

3.	Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green
	and blue. How do you reshape this into a column vector?

1	/	1	point
---	---	---	-------

x = img.reshape((3,32\*32))

x = img.reshape((32\*32,3))

x = img.reshape((32\*32\*3,1))

x = img.reshape((1,32\*32,\*3))

## ✓ Correct

4. Consider the two following random arrays "a" and "b":

1 / 1 point

```
1  a = np.random.randn(2, 3) # a.shape = (2, 3
2  b = np.random.randn(2, 1) # b.shape = (2, 1
3  c = a + b
```

What will be the shape of "c"?

c.shape = (3, 2)

The computation cannot happen because the sizes don't match. It's going to be "Error"!

c.shape = (2, 1)

c.shape = (2, 3)

#### ✓ Correct

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

```
1  a = np.random.randn(4, 3) # a.shape = (4, 3
2  b = np.random.randn(3, 2) # b.shape = (3, 2
3  c = a*b
```

What will be the shape of "c"?

- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- $\bigcirc$  c.shape = (4, 3)
- $\bigcirc$  c.shape = (4,2)
- $\bigcirc$  c.shape = (3, 3)

## ✓ Correct

Indeed! In numpy the "\*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

- 6. Suppose you have  $n_x$  input features per example. Recall that  $X = [x^{(1)}x^{(2)}...x^{(m)}]$ . What is the dimension of X?
  - $(n_x, m)$
  - $\bigcap$  (1,m)
  - $\bigcap$   $(m, n_x)$
  - $\bigcap$  (m,1)

## Correct

Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a\*b" performs an element-wise multiplication.

Consider the two following random arrays "a" and "b":

```
1  a = np.random.randn(12288, 150) # a.shape = (12288, 150)
2  b = np.random.randn(150, 45) # b.shape = (150, 45)
3  c = np.dot(a,b)
```

What is the shape of c?

- c.shape = (12288, 45)
- c.shape = (150,150)
- c.shape = (12288, 150)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

8. Consider the following code snippet:

1 / 1 point

```
1  # a.shape = (3,4)
2  # b.shape = (4,1)
3
4  for i in range(3):
5    for j in range(4):
6    c[i][j] = a[i][j] + b[j]
```

How do you vectorize this?

- $\bigcirc$  c = a + b
- $\bigcirc$  c = a.T + b
- $\bigcirc$  c = a.T + b.T

```
\bigcirc c = a + b.T
```

## ✓ Correct

Consider the following code:

1 / 1 point

```
1  a = np.random.randn(3, 3)
2  b = np.random.randn(3, 1)
3  c = a*b
```

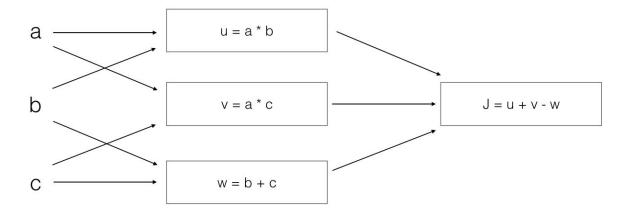

What will be c? (If you're not sure, feel free to run this in python to find out).

- This will invoke broadcasting, so b is copied three times to become (3,3), and \* is an element-wise product so c.shape will be (3, 3)
- This will invoke broadcasting, so b is copied three times to become (3, 3), and \* invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "\*" to operate on these two matrices. You need to instead use np.dot(a,b)

10. 1/1 point

Consider the following computation graph.

What is the output J?

$$\int J = (c - 1)^*(b + a)$$

$$\int J = (a - 1) * (b + c)$$

$$\int J = a*b + b*c + a*c$$

$$\int J = (b - 1) * (c + a)$$

Yes. 
$$J = u + v - w = a*b + a*c - (b + c) = a*(b + c) - (b + c) = (a - 1)*(b + c)$$
.
